

1
2 SYSTEM-WIDE SELECTIVE ACTION MANAGEMENT
3

4 **Abstract**
5

6 A system-wide selective action management facility is provided. Such a
7 facility can support selective action management for multiple applications
8 executing on one or more computer systems (including the operating system and
9 its components, such as a file system). A system-wide action management facility
10 can log actions performed on the computer system(s) and record relationships
11 between such actions (e.g., between actions of different sources, including
12 different documents, different applications and even different computer systems).
13 When a user discovers a mistake, the tool allows the user to select one or more
14 past actions (i.e., the “mistake”) for removal or replacement with one or more
15 correction actions. The tool can also re-execute dependent actions to restore the
16 relevant state of the system at the time of the designation, absent the “mistake”.
17 As such, actions throughout the system can be selectively undone, fixed and/or
18 redone in an exemplary system-wide selective action management tool.
